(54) Title: REQUESTING AND CONTROLLING ACCESS IN A WIRELESS COMMUNICATIONS NETWORK
(57) Abstract: A method, a computer program product and a device for requesting access to a node (BS) of a wireless commu-
nications network (10) are described. In the network (10) identification codes are used to differentiate access requests of different
network components (UE). The method comprises the step of determining information about a transmission path (12) to e.g. the
network node (BS), the step of determining an identification code in dependence on the determined transmission path information,
wherein previously an association between identification codes and transmission path information has been established, and the step
of modulating the selected identification code onto a signal to generate an access request signal carrying transmission path informa-
tion.
